I do not have IsoFix anchor points in my car. Can I have them installed?
This is usually not possible because the IsoFix anchors are almost always installed during production in the factory and are attached to the chassis of the car. However, there are a number of car makes that have been offering the IsoFix system for a number of years as an “option”. In these cars, the assembly points for the anchors are already integrated into the bottom of the car body. Audi and Volvo, for example, offer this option. Talk to your car dealer for more information.

Is IsoFix safer than installing with a car seat belt?
If installed properly, a Maxi-Cosi car seat is the safest in its class. The IsoFix method prevents incorrect installation of the car seat, but is no safer than when the seat is installed using the traditional method. IsoFix prevents incorrect installation because a colour indicator (red or green) is used to indicate the correct installation of various parts.

What is IsoFix?
ISOFIX is an international standardized fitting system, which provides the safest, easiest and quickest way to install a child car seat correctly without the need of vehicle seat belts. The name ISOFIX stands for ISO (International Standardization Organization) plus FIX (Fixation). ISOFIX car seats make use of two standard attachment points located at the base of the seat, plus an anti-tipping forward device: either a support leg or top tether.
From 2006 all new cars are equipped with ISOFIX, and ISOFIX is also fitted in a large number of car brands built prior to 2006.
Find out more about ISOFIX.

The EasyFix ends up fully upright due to the slanted angle of my back seat.
We realise that some cars have a more slanted angle on the back seat than most, but this angle actually enhances the safety level of the Maxi-Cosi CabrioFix in the event of an abrupt stop or a head-on collision, since the child is ‘pushed’ into the car seat. To ensure that your child is sitting comfortably, you can place a small pillow under the child's behind and head to provide added support. If in doubt, you can send us pictures of the situation so that we can advise you more specifically.

How to ensure a correct Top Tether installation?
What is key is to always check the Top Tether is correctly tight. An green indicator on the Top Tether is ensuring the correct tension. To obtain the best tension of the Top Tether, you should look for the shorter routing, going directly from the top of the car seat to the Top Tether hook (often located on the luggage compartment). We recommend to remove the headrest to avoid deviate the top tether routing from this shorter route, and consequently ensure a very tight installation in any situations. Installing the top tether in between the headrest or on top of the headrest can deviate his natural routing, and be less efficient in case of impact.

How to find the location of the Top Tether anchorage?
Unfortunately, there is no standard location for Top Tether anchorage in the car. Most often, this anchorage is located in the luggage compartment, just behind the rear seats. Now most of the new cars models identify this anchorage with a Top Tether label, where you can see a drawing of a car seat with anchor at the back. To help you to find this anchorage, we invite you to go in our online car fitting list, select your car, and we will show you in which area is located this anchorage. This list is not complete but is regularly updated for your convenience. If you have any doubts, or if you don't find the
information, please look at the car instruction manual. Be careful, some anchorages are made to attach a luggage mesh and are not strong enough to attach the top tether.

Can I install the EasyFix base both with the ISOFIX anchors as well as the car seat belt?

Yes a unique feature of the EasyFix is that you can both install the base by the car’s seat belt as well as by ISOFIX.

The EasyFix ends up fully upright due to the slanted angle of my back seat. We realise that some cars have a more slanted angle on the back seat than most, but this angle actually enhances the safety level of the Maxi-Cosi CabrioFix in the event of an abrupt stop or a head-on collision, since the child is ‘pushed’ into the car seat. To ensure that your child is sitting comfortably, you can place a small pillow under the child's behind and head to provide added support. If in doubt, you can send us pictures of the situation so that we can advise you more specifically.

The EasyBase 2 ends up fully upright due to the slanted angle of my back seat. Indeed some cars have quite a steep angle of the back seat because of which the EasyBase 2 is placed upright. This does however not lead to a worse safety performance. In order to enhance the comfort of your baby, you can use the seat reducer so that the baby’s body is totally supported. You can also place a towel or something similar underneath the EasyBase 2 to level the installation.
